

students and thereby indirectly initiated the project. Thomas Kuhn, Gerald Holton, and the late Francis Friedman of the Physical Science Study Committee strongly influenced my view of what is important in physics. My associates in the Science Curriculum Improvement Study, especially Carl Berger, Joseph Davis, Chester A. Lawson, Marshall Montgomery, Luke E. Steiner, Laurence Strong, and Herbert D. Thier, helped me in selecting and refining my approach to the subject matter. Stephen Williams and Michael von Herzen assisted in the preparation and evaluation of a preliminary edition of this text. Diane Bramwell and my wife Elizabeth contributed to the production of the present edition.

I wish to acknowledge also the assistance of many publishers, organizations, and individuals who have made figures and photographs available to me. A detailed listing appears below in the Acknowledgments.

Two large groups of young people have contributed greatly to the preparation of this work. One of these consists of my physics students at Berkeley, who responded sometimes with enthusiasm and sometimes with despair to my teaching and to a preliminary edition. The second of these consists of the many elementary school children (including Beverly, Peggy, Richard, Barbara, Andy, David, and Peter Karplus) in whose classes I have had the privilege to teach. The knowledge gained from the feedback from both these groups has been of immeasurable value.

Finally, the current spirit of innovation in education, which has been fostered by the National Science Foundation during the past decade, has provided the indispensable background for my undertaking.

Robert Karplus
